

Supplemental Figure 1. Fibroblast subtype populations present before (a) and after (b) cytokine stimulation. Visualization of raw normalized counts (a) and log₂FC for DEGs (b) using the top 10 cell markers for each fibroblast subtype cluster identified in the scRNA-seq dataset.

A

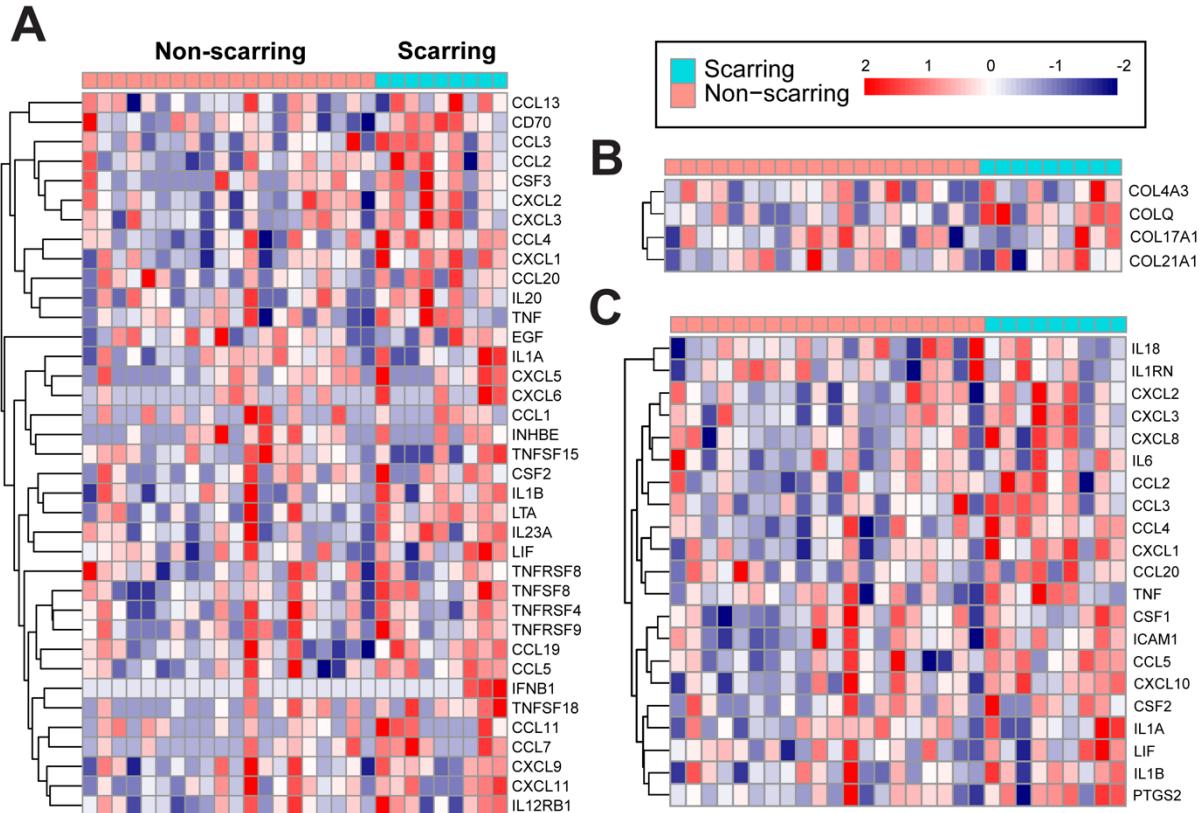

B

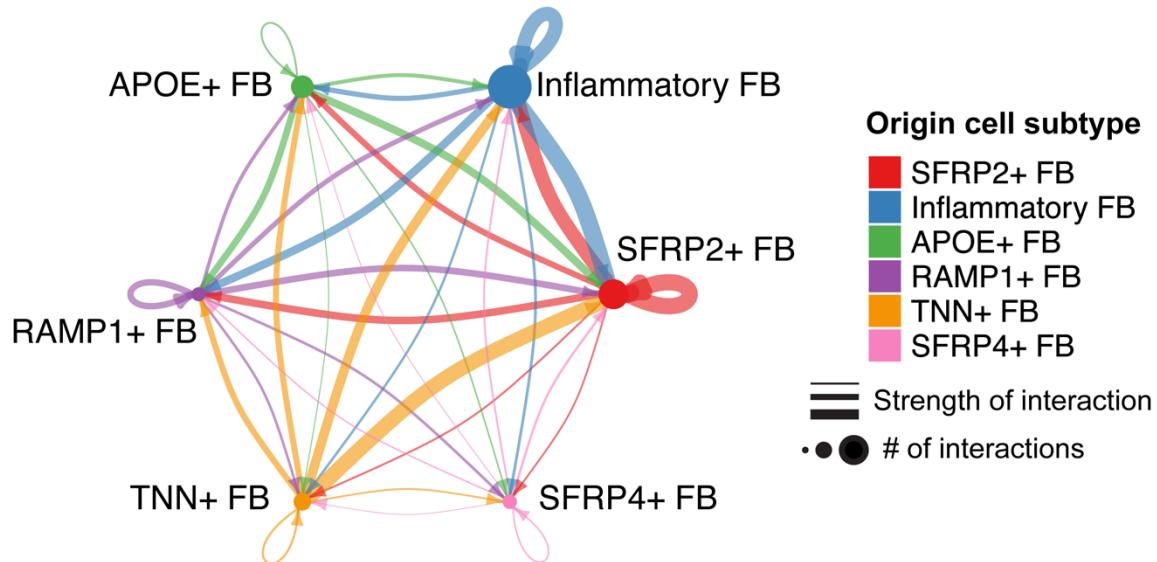

Supplemental Figure 2: Workflow schematic for SCLE vs. DLE single cell RNA sequencing analysis.

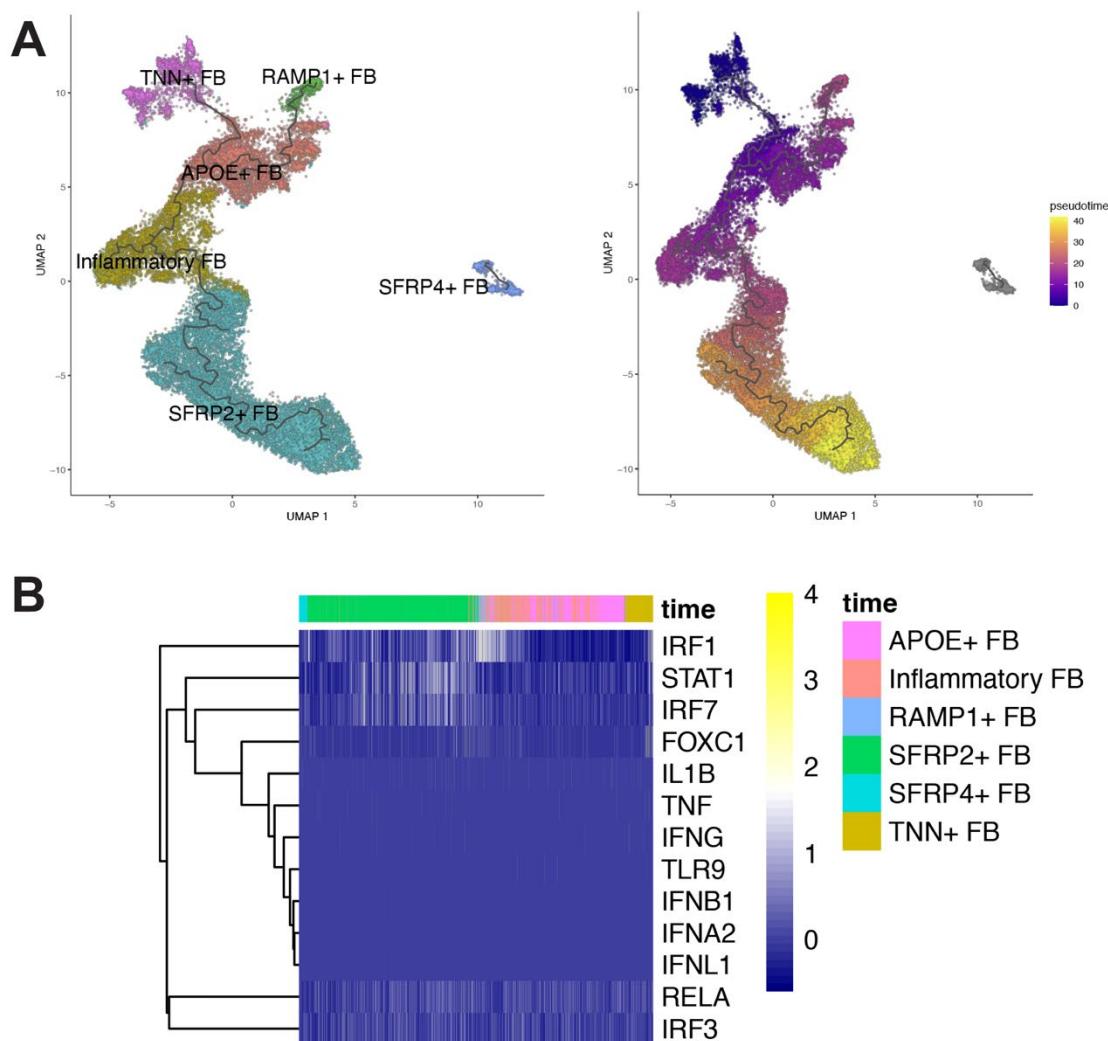

Supplemental Figure 3: Upregulation of inflammatory pathway and collagen genes skewed in fibroblasts are found in lesional biopsies from scarring or non-scarring CLE. Heatmaps illustrating the relatively higher upregulation of **a)** cytokine-cytokine receptor pathway, **b)** collagen pathway, and **c)** inflammatory pathway genes in lesional bulk RNA-seq data from patients with DLE (scarring) vs. SCLE (non-scarring).

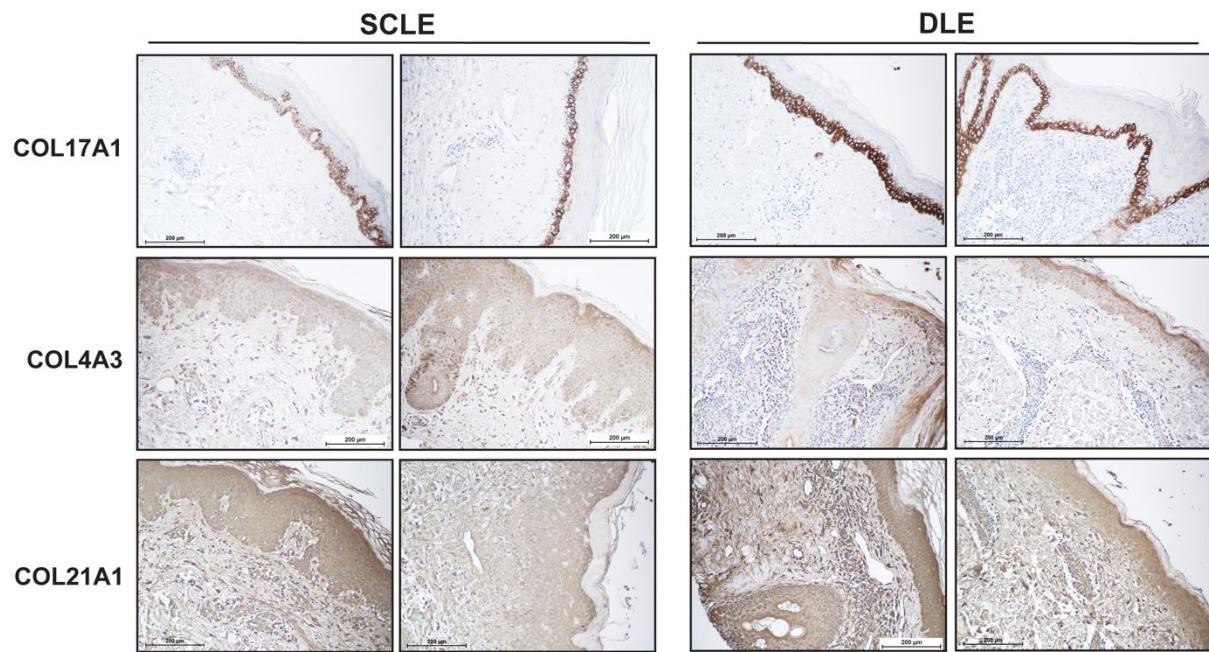

Supplemental Figure 4: Cell-cell interactions. Visualization of cell-cell communications from the single-cell data using CellChat (9). Node size indicates number of interactions and edge weight denotes strength of interaction. Numerous strong interactions are noted between inflammatory fibroblasts and SFRP2+ fibroblasts.

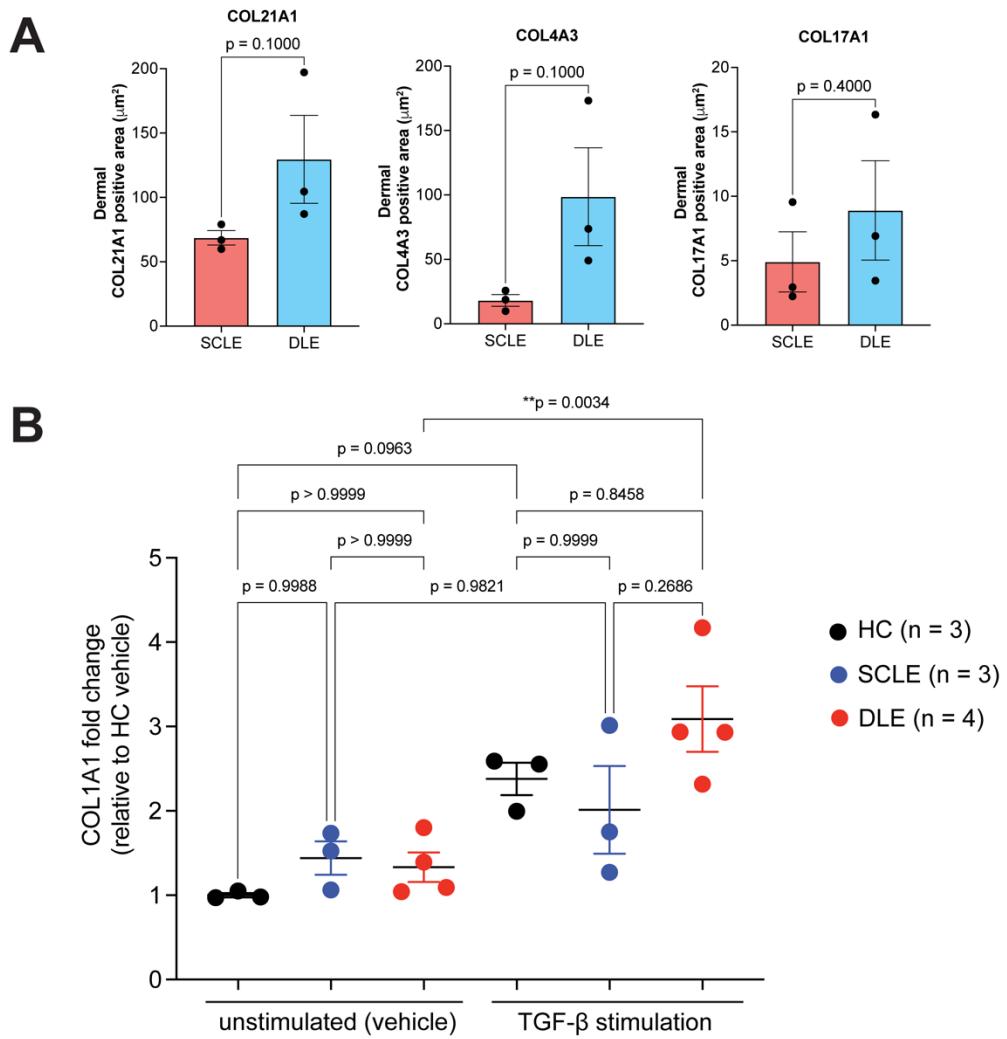

Supplemental Figure 5: Pseudotime analysis. Pseudotime trajectory between the various subtypes of fibroblasts (A) and heatmap showing gene expression for each of the subtypes across pseudotime (B).

Supplemental Figure 6. Additional immunostaining for specific collagens in lesional skin sections from additional lupus patients with SCLE or DLE. Formalin-fixed paraffin-embedded tissue sections from lesional skin were stained for COL17A1, COL21A1, and COL4A3. Representative images from different patients of each subtype are shown at 200X magnification with a scale bar of 200 μ m.

Supplemental Figure 7. TGF- β induces significantly high levels of COL1A1 expression in dermal fibroblasts from SLE patients with scarring skin disease. (A) Quantification of immunostaining for COL21A1, COL4A3, and COL17A1 from Figure 6. (B) Dermal fibroblasts isolated from healthy control (HC, n=3) volunteers or from the non-lesional skin of patients with non-scarring (SCLE, n=3) or scarring (DLE, n=4) CLE were treated with vehicle or stimulated with 10 ng/mL TGF- β for 24 hours. Collagen type I alpha 1 (COL1A1) expression was quantified by qPCR. Expression was normalized to β -actin and compared to untreated HC. Data were analyzed by one-way ANOVA; p-values for all comparisons are shown, and the statistically significant response is denoted by asterisks (**p-value < 0.01).

Supplementary Table 2: Significantly differentially expressed genes under each condition (Healthy Control - HC, Lupus - L, Non-scarring - NS, and Scarring - S) for each stimulation (online access).

Supplementary Table 3: Negative (Neg) and Positive (Pos) Effect Sizes (ES) across condition comparisons (HC vs. L and S vs. NS) for each stimulation (online access).

Supplementary Table 4: Summary statistics for the differential expression analysis between scarring and non-scarring lesional skin samples from lupus patients (online access).

Supplementary Table 5: Medications reported from the time of enrollment
